Mohit Murali Alumullithody [malumull@iu.edu](mailto:malumull@iu.edu)

Rahul Gopichand Shamdasani [rshamdas@iu.edu](mailto:rshamdas@iu.edu)

**Rankings**

---

**1. Social Media**

After a decent amount of discussion, we've come to the conclusion that this project would be most interesting to us. We have a lot of ideas that range from integrating new technologies, to implementing long requested features on similar sites, such as a downvote button on instagram, or an edit button on twitter. We can also accommodate having different types of users if you would prefer. For example, a reddit style grouping system with moderators or some sort of proxy voting system.

**2. Rental Services & Management System**

There was a large interest amongst the group in this particular theme. We have all used Airbnb or VRBO type services, and are very interested in making a clone perhaps for a different type of product. Marketplaces in general are really interesting. They have a network effect built in, you can seed one side manually to get it going - lots of cool particulars to work with.

**3. Job Board**

We really like this one as well. There's a never ending need to match candidates with companies who need their services, and yet no silver bullet to really tackle that. The best ones tend to focus on a particular niche, as each one has its own set of idiosyncrasies. There are always new niches emerging and thus a never ending need to tailor to that group. Off the top of my head, aside from people randomly posting on blockchain

subreddits, there really isn't a great web3 dev job board, despite there being tons of new startups and devs in the space.
